Cluj-Napoca, Romania

## **SUMMARY**

This paper deals with some aspects of human viruses in the environment. Thus, a systematization of these viruses was made on the basis of their elimination from the human body and also with regard to their detection in various segments of the environment. The data compiled lead to the conclusion that virtually any human virus, of any taxonomic group known, may be present, in one or another segment of the environment, at one or another time.

*Key words:* human viruses, environmental virology
